

## Organic Chemistry

- Many compounds are built around the carbon atom
  - Organic Chemistry focuses on these compounds
    - Contain carbon and other atoms such as H, O, N, S, P...
    - >10 million compounds
  - Natural or “synthetic”
  - Huge variety due to many bonding possibilities for carbon
- Approaches for representing organic compounds
  - Examples: hexane, acetaminophen ( $C_8H_9NO_2$ )

## Functional Group Chemistry

- Even though there are many organic compounds, it is possible to categorize compounds by looking at how the atoms are arranged
  - **Functional Group** – portion of a compound that has a characteristic arrangement of atoms and characteristic properties and reactivity.
- Functional Groups are the key to understanding organic chemistry!

Functional Group	Formula	Structure	Properties
Alkane	C-C and C-H single bonds		
Alkene	$R_2-C=C-R_2$		
Alkyne	$R-C\equiv C-R'$		
Alcohol	R-OH		
Ether	R-O-R'		

## Functional Group Chemistry

- Because of common reactivity of functional groups, it is possible to predict reactivity of organic compounds

- EXAMPLE: Ester formation: Esters can be formed by the dehydration reaction of an alcohol and a carboxylic acid.

- “R” can be any group

Table 9.4 Selected Organic Functional Groups

Name of Class	Functional Group <sup>a</sup>	General Formula of Class
Alkane	None	R-H
Alkene	$\text{C}=\text{C}$	$\text{R}_2\text{C}=\text{CR}_2$
Alkyne	$\text{C}\equiv\text{C}$	$\text{RC}\equiv\text{CR}$
Alcohol	$\text{C}-\text{OH}$	R-OH
Ether	$\text{C}-\text{O}-\text{C}$	R-O-R'
Aldehyde	$\text{C}-\text{H}$	$\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{H}$
Ketone	$\text{C}-\text{C}$	$\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{R}'$
Carboxylic acid	$\text{C}-\text{OH}$	$\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-\text{H}$
Ester	$\text{C}-\text{O}-\text{C}$	$\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-\text{R}'$
Amine	$\text{C}-\text{N}$	$\text{R}-\overset{\text{H}}{\underset{\text{H}}{\text{N}}}-\text{H}$ $\text{R}-\overset{\text{H}}{\underset{\text{R}'}{\text{N}}}-\text{H}$ $\text{R}-\overset{\text{R}''}{\underset{\text{R}'}{\text{N}}}-\text{R}''$
Amide	$\text{C}-\text{N}$	$\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{H}}{\underset{\text{H}}{\text{N}}}-\text{H}$ $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{H}}{\underset{\text{R}'}{\text{N}}}-\text{R}'$ $\text{R}-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\underset{\text{R}'}{\text{N}}}-\text{R}''$

<sup>a</sup> Neutral functional groups are shown in green, acidic groups in red, and basic groups in blue.

## Functional Group Chemistry

So, we can build larger, more complicated molecules by taking advantage of functional group reactivity!

- Regardless of whether we're talking about small molecules like methanol or huge molecules like proteins, behavior typically boils down to functional group reactivity!

## Identification and Naming of Organic Compounds

Two key criteria

1. Types of functional groups present
2. Length of carbon backbone
  - Prefix tells length of carbon chain
  - Virtually any organic compound can be named based on rules developed from these criteria.

Name	Molecular Formula	Structural Formula	Isomers
methane	CH <sub>4</sub>	CH <sub>4</sub>	1
ethane	C <sub>2</sub> H <sub>6</sub>	CH <sub>3</sub> CH <sub>3</sub>	1
propane	C <sub>3</sub> H <sub>8</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>3</sub>	1
butane	C <sub>4</sub> H <sub>10</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	2
pentane	C <sub>5</sub> H <sub>12</sub>	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>3</sub> CH <sub>3</sub>	3
hexane	C <sub>6</sub> H <sub>14</sub>	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>4</sub> CH <sub>3</sub>	5
heptane	C <sub>7</sub> H <sub>16</sub>	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>5</sub> CH <sub>3</sub>	9
octane	C <sub>8</sub> H <sub>18</sub>	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>6</sub> CH <sub>3</sub>	18
nonane	C <sub>9</sub> H <sub>20</sub>	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>7</sub> CH <sub>3</sub>	35
decane	C <sub>10</sub> H <sub>22</sub>	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>8</sub> CH <sub>3</sub>	75

## Organic Nomenclature

### IUPAC Rules for Alkane Nomenclature:

1. Find and name the longest continuous carbon chain.
2. Identify and name groups attached to this chain.
3. Number the chain consecutively, starting at the end nearest a substituent group.
4. Designate the location of each substituent group by an appropriate number and name.
5. Assemble the name, listing groups in alphabetical order.

*The prefixes di, tri, tetra etc., used to designate several groups of the same kind, are not considered when alphabetizing.*

### Alkyl Substituents:

Group	Name	Group	Name
CH <sub>3</sub> -	Methyl	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> -	Butyl
C <sub>2</sub> H <sub>5</sub> -	Ethyl	(CH <sub>3</sub> ) <sub>2</sub> CHCH <sub>2</sub> -	Isobutyl
CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> -	Propyl	CH <sub>3</sub> CH <sub>2</sub> CH(CH <sub>3</sub> )-	sec-Butyl
(CH <sub>3</sub> ) <sub>2</sub> CH-	Isopropyl	(CH <sub>3</sub> ) <sub>3</sub> C-	tert-Butyl

## Isomers

**Isomers:** different compounds with same molecular formula

**Stereoisomers:** isomers where connections are same, but arrangement in space different

**Constitutional Isomers:** isomers where atoms are connected differently

**Enantiomers:** stereoisomers that are mirror images

**Diastereomers:** stereoisomers that are not mirror images

**EXAMPLE:**  $C_2H_2Cl_2$  has 3 possible structures, only 2 are diastereomers

## Enantiomers

Molecules that have Enantiomers are Chiral

- Amino Acids are one Enantiomer
- Some bacteria use the amino acids of the other chirality to trick their hosts

Enantiomers have similar physical properties (nearly identical)

- Interact differently with polarized light
- May have dramatically different reactivity
  - Thalidomide

## Polymer Chemistry

“Big” molecules, but the result of several functional group reactions

Polymer properties depend on several factors, including:

- the chemical composition of the monomer units,
- length of the chain,
- the three dimensional arrangement of the chains in the solid,
- the branching in the chain,
- the bonding/interaction between chains,

**Plasticizers:**

**Crosslinking:**

## Polymerization Reactions

Two major classes of polymerization reactions: Addition and Condensation

**Addition Polymerization** – no other products are formed

*Examples:* polyethylene and polystyrene
