

13. Outline the main points of Dalton's atomic theory. Identify one area of his theory that we now understand to be incorrect. (8 points)

14. Convert the following formulas to names or names to formulas: (4 points each)

Name	Formula
potassium carbonate	
	$\text{Cu}_2\text{O}$
	$\text{N}_2\text{S}_4$

15. Rank the compounds below in order of boiling point, from lowest to, middle, to highest. Clearly explain your reasoning. Ignore any effects of molecular mass. (8 points)

Compound	Propane	Formic Acid	Methyl Ether
Formula	$\text{CH}_3\text{CH}_2\text{CH}_3$	$\text{CHCOOH}$	$\text{CH}_3\text{OCH}_3$
Lewis Structure	$  \begin{array}{c}  \text{H} \quad \text{H} \quad \text{H} \\    \quad   \quad   \\  \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \\    \quad   \quad   \\  \text{H} \quad \text{H} \quad \text{H}  \end{array}  $	$  \begin{array}{c}  \text{:O:} \\     \\  \text{H}-\text{C}-\ddot{\text{O}}-\text{H} \\  \quad \quad \quad \cdot\cdot  \end{array}  $	$  \begin{array}{c}  \text{H} \quad \quad \text{H} \\    \quad \quad   \\  \text{H}-\text{C}-\ddot{\text{O}}-\text{C}-\text{H} \\    \quad \quad   \\  \text{H} \quad \quad \text{H}  \end{array}  $
Rank (low, middle, high)			

**Part III.** Complete 3 of the following 4 problems. Clearly mark the problem you do not want graded. Each problem is worth ten (10) points. You must show your work on calculations to receive partial credit. Report numerical results to the correct number of significant figures and with the appropriate units.

16. Describe the similarities and differences in the electronic structures of fluorine and bromine. Include an electron configuration for each of the atoms. Why do both atoms tend to form anions with a charge of negative one (1-)?

17. In class we noted that one of the requirements of a polar molecule is the presence of polar bonds. Describe how to characterize a bond as polar or not and explain how a molecule that contains polar bonds can actually be *nonpolar*.

18. An oxide of tin with the formula SnO consists of 0.742 g tin and 0.100 g oxygen.
- If 1.327 g tin and 0.325 g oxygen are allowed to react, how much SnO could be produced?

- A sample of a second oxide of tin consists of 0.555 g tin and 0.150 g oxygen. What is the formula for this second oxide?

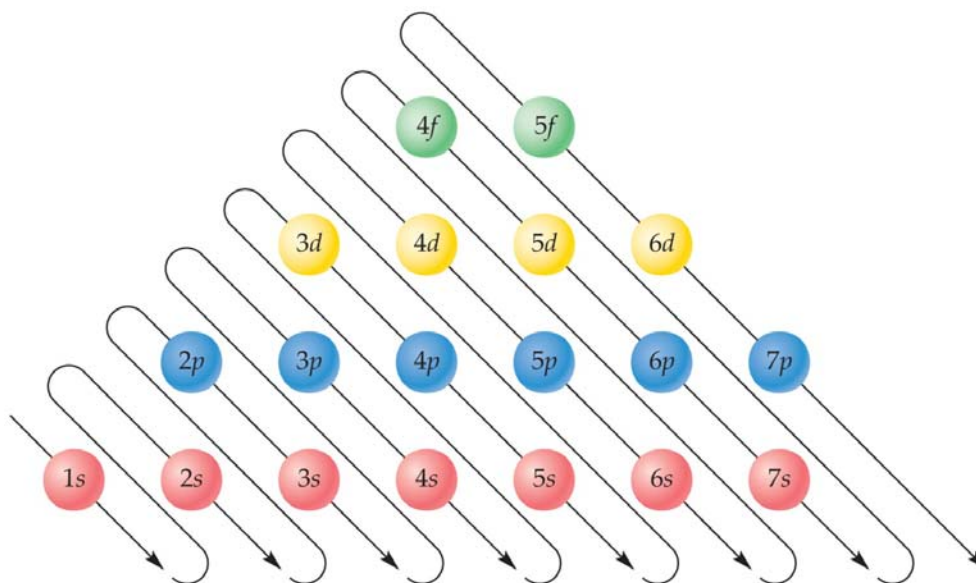

19. Perform the following conversions:

- Express  $7.5 \times 10^{-6}$  m, the diameter of a red blood cell, in nonscientific (decimal) notation. (3 points)

- Convert 32.5 inches to mm. (1 inch = 0.0254 m) (4 points)

- Convert  $3.2 \times 10^5$  nm to mm. (3 points)

Numbers in parenthesis are mass numbers of most stable or most common isotope.

Atomic weights corrected to conform to the 1963 values of the Commission on Atomic Weights.

The group designations used here are the former Chemical Abstract Service numbers.
